HYDROFLOW – PATENTED FERRITE TECHNOLOGY

HydroFlow is a Super Green product – It uses very little energy, requires no consumables - ie filters or salts - and has a very long life. The calculated mean time between failures is 35 years. So you have to buy it only once. With HydroFlow, your water heater, washing machines, shower heads and taps etc will have a much longer useful life and your water pipes will last almost for ever. You will save on conditioners, cleaning products, soap, shampoo and skin creams as well.

WHAT TO EXPECT FROM YOUR HYDROFLOW

<p>Faster and Cheaper Hot Water lime scale absorbs heat. By removing the layer of lime scale, you will reduce the cost of water heating by 20% or more; which will have a positive effect on your energy bill</p>	<p>White Scale & Powder in the shower and taps. In the first few months, you may need to clean the filters on the taps more often, to clear particles of scale that have been loosened HydroFlow. In very hard water areas, you will find white powdery deposits (calcite crystals) instead of hard lime scale.</p>	
<p>A Lower Water Bill You will notice after a time that the hot water reaches the tap quicker, which means you will use less water.</p>	<p>Soap Works Better You will need to use less shampoo or soap to get a good lather. Your hair may be more manageable. The washing machine requires less conditioner.</p>	
<p>Better Water Pressure Without lime scale in the pipes, the water will flow through the system better. You can shower, without having to worry about someone else opening a tap.</p>	<p>Less Skin Irritations Water is less abrasive. If you suffer from sensitive skin, you will need to use less skin creams. Children with eczema seem to benefit a lot.</p>	
<p>Car wash with less white marks You will find many less white marks on your car after a car wash; and the marks that are there, wipe off much more easily.</p>	<p>Less Chlorine After Taste The water will have less taste of chlorine. HydroFlow reduces the formation of fixed chlorine, which is the main reason tap water may have an unpleasant taste.</p>	
<p>calcite powder in a kettle</p>	<p>White in the Kettle - If hot water is left in the kettle for days, a white powdery deposit will form, particularly in areas of very hard water. This will be calcite powder not hard scale. You need to rinse the kettle with water now and again. But you won't need to use abrasive anti-limescale products.</p>	<p>kettle after a wash with water</p>
<p>RESULTS GUARANTEED - If HydroFlow does not do what it should – ie prevent lime scale – you may return it any time in the first 12 months and get a refund.</p>		
<p>HydroFlow is manufactured in the UK and is one of the few green products, that pays for itself within 12 months. It's a great cost saver. If you are happy with HydroFlow, please spread the word</p>
